Updates

August 18, 2004: Created new SQL 2000 request table for queuing requests. Timer fires every 30 seconds to determine if queued request record is more than five minutes old. If so, EDS is queried for any records that are \geq 5 minutes in age.

August 18, 2004: Incorporated WAV files into SAPI output for IVR.

August 17, 2004: HTTP connector was not disconnecting prior to querying song play database causing NT service to hang. Corrected.

August 16, 2004: Song requests are queued now for 3-5 minutes to enable BDS system to obtain correct song identity. Thus requests made contemporaneously with the broadcast of the song will result in the correct identification of the song via an email arrival. 215
